

ABSTRACT OF THE DISCLOSURE

A partition wall defines a plurality of chambers adapted to accommodate terminals which are inserted from a rear end portion of a housing body. The partition wall is formed with a recessed part. A pair of opposite side walls and a bottom wall interconnecting the side walls define a recessed space at a front end portion of the housing body such that front ends of the terminals accommodated in the chambers are exposed therefrom. Each of the side walls is formed with a recessed part. A front holder is fitted into the recessed space in a first direction to cover the exposed front ends of the terminals. The front holder has a pair of first projections, each of which is formed with a first flat face facing in a second direction opposite to the first direction and extending in a third direction perpendicular to the first direction, and is adapted to be engaged with the recessed part of each of the side walls. The front holder has a second projection, which is formed with a second flat face facing in the second direction and extending in the third direction, and is adapted to be engaged with the recessed part of the partition wall.
